Executive Summary

This report presents a supply chain analysis of Packages Convertors Limited (PCL), Pakistan's largest packaging company. Established in 1956 as a joint venture between the Ali Group of Pakistan and Akerlund & Rausing of Sweden, PCL today operates as the manufacturing subsidiary of Packages Limited and serves as the backbone of Pakistan's packaging industry.

PCL operates three core business units Flexible Packaging (46% of revenue), Folding Cartons (25%), and Consumer Products / Rose Petal (29%) serving multinational clients including Unilever, Nestle, and PepsiCo. The company holds the largest market share in tissues, folding cartons, and flexible packaging in Pakistan, with annual net sales of PKR 49.3 billion in CY23 and a credit rating of AA- (PACRA).

This report covers PCL's company background, mission and vision, products and services, competitive strategy, supply chain metrics and drivers, distribution model, manufacturing process, generalized supply chain model, pipeline mapping, and recommendations for improvement. Primary research was conducted through a field visit and interview at PCL's Lahore facility, supplemented by annual reports and publicly available data.

2. Introduction of the Company

2.1 Historical Background

The story of Packages Limited begins in 1954, when Syed Babar Ali visited Sweden and proposed a partnership with Akerlund & Rausing a leading Swedish packaging firm to establish a packaging manufacturing facility in Pakistan. The primary motivation was to reduce the Ali Group's dependence on imported packaging for Treet Corporation's razor blade operations. Government approval was granted after nearly two years, and construction began in late 1956 with 22 Swedish experts involved in the initial phase.

The ownership structure allocated 77.31% equity to the Ali family and 22.69% to the Swedish partner in exchange for technical expertise and European machinery. By 1964, output had doubled compared to 1957. The company went public in 1965, raising PKR 16 million, and the International Finance Corporation (IFC) acquired a 13% stake. By 1974, Packages was operating its own paper mill and producing cartons, wrappers, labels, corrugated boxes, and Tetra Pak containers for the dairy and beverage industries. Annual sales growth averaged 15% since 1968.

In 2019, following an internal restructuring, all manufacturing operations were transferred to a newly incorporated wholly-owned subsidiary Packages Convertors Limited (PCL) which now serves as the operational and manufacturing backbone of the entire Packages Group. Packages Limited itself became an investment holding company.

2.2 Company Profile Packages Convertors Limited

Packages Convertors Limited is headquartered at Shahrah-e-Roomi, Amer Sidhu, Lahore, and operates manufacturing plants in Lahore, Kasur, and Karachi. The company employs over 4,000 people and operates a self-contained industrial campus that includes a 10.4 MW captive power plant. PCL holds the largest market share in flexible packaging, folding cartons, and tissue products in Pakistan. It exports to the Middle East, Africa, Sri Lanka, and South Asia, and has international sister companies including Packages Lanka (Sri Lanka) and Channel Packages (Kenya). PCL is rated AA- (Long Term) and A1 (Short Term) by PACRA, reflecting strong financial health and governance.

3. Mission, Vision and Objectives

Vision

Packages Convertors Limited envisions positioning itself as a regional player of quality packaging and consumer products. This ambition drives every strategic decision from technology investment to talent development ensuring PCL continuously raises the bar for packaging excellence not just within Pakistan, but across South Asia and beyond.

Mission

PCL's mission is to rely on continuous enhancement of its technological competence to seek innovative solutions for customer needs, and to attract and retain outstanding professionals by maintaining a culture of openness and innovation. The mission rests on two pillars technological innovation and people development recognizing that sustainable success requires cutting-edge processes powered by a motivated workforce.

Objectives

PCL's core objectives are to offer profitable growth for investors by bringing together people, management systems, technology, and opportunities, and to serve society by setting the highest standards of corporate ethics. The company pursues new and innovative solutions across all products and services, complying with the most stringent quality standards to deliver its promise of unmatched packaging solutions. As stated in the CEO's message, PCL's overriding purpose is to improve quality of living and drive sustainability through a triple bottom line approach of People, Planet, and Prosperity, in alignment with the United Nations' Sustainable Development Goals (SDGs).

4. Products and Services

PCL operates across two core segments Packaging (Flexible Packaging and Folding Cartons) and Consumer Products (Tissue and Sanitary Napkins) serving industries ranging from food and beverages to pharmaceuticals, hygiene, and general consumer goods.

4.1 Flexible Packaging 46% of Revenue

Flexible packaging is PCL's largest revenue segment. Products include multi-layer laminates, pouches, wrappers, and film rolls used across food, snack, dairy, and pharmaceutical packaging. PCL uses high-speed Rotogravure printing presses and solvent-less lamination lines to deliver food-safe, barrier-engineered packaging to multinational clients including Unilever, Nestle, and PepsiCo. The company exports flexible packaging to the Middle East, Africa, Sri Lanka, and South Asia.

4.2 Folding Cartons 25% of Revenue

Folding Cartons are precision-engineered, printed cardboard cartons used across food, beverages, personal care, and pharmaceutical industries. PCL is the only company in Pakistan with a 10-colour Rotogravure press with an additional UV unit a distinction that gives it unmatched print quality and production capability in the domestic market. One-side coated board enhances ink adhesion, while poly-coated variants protect contents from moisture.

4.3 Consumer Products Rose Petal (29% of Revenue)

The Rose Petal brand is Pakistan's largest tissue and hygiene brand, commanding a 62% market share in the tissue segment. Products include facial tissue boxes, kitchen rolls, pocket tissues, table napkins, cocktail napkins, and sanitary napkins. PCL uses the Italian OMET TV503 tissue converting line running at up to 600 m/min for high-speed automated production. Rose Petal serves retail consumers nationally through modern trade and general trade, and the HoReCa (Hotels, Restaurants, Cafes) channel with customized napkin solutions for McDonald's, KFC, and Subway.

4.4 Additional Services

PCL is also engaged in mechanical fabrication and roll covers a specialized technical service supporting the broader manufacturing and printing industry. Value-added services include in-house art design, research and development, and rigorous quality control throughout production.

5. Competitors and Customers

5.1 Competitors

In the domestic market, PCL faces competition from several packaging companies. Key local competitors include Merit Packaging Limited (corrugated and cardboard packaging), Roshan

Packages Limited (corrugated packaging for FMCG, electronics, and agriculture), Rototec Packaging Limited (flexible packaging with over 15 years of experience), Lucky Core Industries (industrial and specialty packaging), Prime Packages, Oasis Packaging Industries, and Sadiq Paper Products. Even within the Packages Group, sister company Bulleh Shah Packaging competes in corrugated and liquid packaging board.

On the international front, PCL competes indirectly with global giants such as Amcor, SIG Combibloc, Smurfit Kappa, Mondi Group, and Tetra Pak all of which set high benchmarks in sustainable and technically advanced packaging. However, as confirmed during our field visit, no domestic or regional competitor can match the volume, breadth, and capability that PCL handles. PCL serves approximately 35% of Pakistan's total packaging needs, a dominance that no rival comes close to replicating.

5.2 Customers

PCL's B2B customer base is built on long-standing relationships with multinational FMCG companies. Unilever and Pakistan Tobacco Company have been customers for over 50 years. Nestle Pakistan is served across dairy, beverages, confectionery, and infant nutrition. PepsiCo Pakistan requires flexible film packaging for Lays and Kurkure and carton packaging for beverages. Other major clients include Hilal Foods, Dalda Foods, Dollar Industries, Al-Karam Textile Mills, and H. Nizam Din & Sons.

In the QSR sector, McDonald's, KFC, and Subway are supplied with food-grade tissue and napkin products through the Rose Petal division. For its Consumer Products segment, the end customer is the retail consumer, reached through supermarkets, pharmacies, kiriyana stores, and HoReCa distributors nationwide. Internationally, PCL exports packaging materials and tissue products to the Middle East, Africa, Sri Lanka, and South Asia.

6. Major Suppliers and Raw Materials

PCL's supply chain is deeply globally integrated, with raw materials and machinery sourced from across four continents. The following are the key inputs and their sources:

- **Chemical Wood Pulp USA, Sweden, China, Canada:** The most critical raw material for tissue paper and paperboard production is chemical wood pulp, entirely imported since Pakistan has no domestic pulp industry. The United States supplies 49% of Pakistan's pulp

imports, Sweden 14%, and China 12%. Sweden holds special historical significance Packages Limited was founded with Akerlund & Rausing of Sweden. The group's 50/50 joint venture with StoraEnso OYJ of Finland (one of the world's largest pulp producers) in Bulleh Shah Packaging further cements Scandinavia as a primary raw material relationship.

- **Polypropylene Films Tri-Pack Films Limited (Group Company):** For flexible packaging, the primary inputs are BOPP and CPP films sourced from Tri-Pack Films Limited a group company and Pakistan's top BOPP/CPP film manufacturer, established as a JV between Mitsubishi Corporation (Japan) and Packages Limited. This intra-group arrangement gives PCL a significant cost and supply security advantage. The underlying polypropylene resin is imported from the Middle East SABIC (Saudi Arabia), Borouge, and Borealis as no domestic manufacturer exists in Pakistan.
- **Printing Inks DIC Pakistan Limited (Group Company):** Printing inks are sourced from DIC Pakistan, Pakistan's largest printing ink manufacturer and a group joint venture with DIC Asia Pacific of Singapore (established in 1993). This vertical integration gives PCL priority access to consistent, high-quality inks without import dependency or supply risk.
- **Specialty Chemicals OmyaPack (Switzerland):** For specialty coatings and mineral-based additives, PCL relies on OmyaPack a joint venture between Omya of Switzerland and Packages Limited. Omya is one of the world's largest calcium carbonate producers, providing European-grade coatings essential for premium folding carton surface quality.
- **Machinery Germany & Italy:** Converting and printing machinery comes from W&H (Windmoller & Holscher), Bobst, and Riviera globally recognized leaders in packaging machinery. For tissue converting, the OMET TV503 Line from Italy is used. PCL also has a strategic partnership with Sauer (Germany) for printing roller technology, reducing dependency on imported press components and improving maintenance turnaround times.

7. Competitive & Supply Chain Strategy

7.1 Competitive Strategy

Packages Convertor Limited holds a dominant position in Pakistan's packaging industry. The company was established in 1956 when a Swedish firm, Åkerlund & Rausing, came to Pakistan

and set up its machinery and operations. Since then, it has grown into Pakistan's largest and most well-known packaging company, operating across three core business units: Flexible Packaging, Cartons, and Consumer Products.

The Consumer Products division which includes household brands such as Rose Petal, Toilet Roll, and Max Epi alone commands approximately 75% of the market share in its category. This sheer scale and volume is the company's strongest competitive advantage. As confirmed during our visit, no competitor in Pakistan can match the volume and quantum that Packages handles. In the flexible packaging segment, competitors like Compass (Karachi), Saima Packages, and Charat Packages exist, and in cartons, Century Paper Mill poses some competition. However, in terms of overall capacity, quality, and brand recognition, Packages stands virtually unchallenged in the domestic market.

On the international front, the company has extended its footprint through two sister companies Packages Lanka in Sri Lanka and Channel Packages in Kenya. This international presence reinforces the Group's long-term strategy of becoming a regional leader in packaging solutions.

7.2 Supply Chain Strategy & Strategic Fit

Packages operates a hybrid supply chain strategy. For its Flexible and Carton divisions, which serve large B2B clients such as Unilever, Nestlé, Al-Fateh, and Jalal Sons, the supply chain is built around responsiveness and reliability. These customers supply their own product specifications and expect consistent quality, on-time delivery, and quick turnaround on new orders.

For the Consumer Products division (Rose Petal, tissue paper), the supply chain shifts toward a B2C model, where finished goods reach the end consumer directly. This division demands a more efficient, high-volume supply chain focused on cost management and market availability.

The company's stated vision of becoming 'One Company' reflects its strategy of integration aligning procurement, production, warehousing, and delivery into a single, coherent system. The overall supply chain strategy achieves strategic fit by balancing upstream efficiency (bulk procurement, long-term supplier contracts) with downstream responsiveness (system-based order processing, dedicated warehousing for key clients).

8. Supply Chain Metrics & Drivers

8.1 Key Supply Chain Metrics

Packages Convertor Limited tracks its supply chain performance across several important dimensions. On-time delivery is a critical metric, particularly for major clients like Unilever and Nestlé who operate their own strict safety and delivery standards including requirements for vehicles to be in good condition and properly maintained before goods are accepted. Order accuracy and fill rate are closely monitored to ensure complete, defect-free shipments leave the facility.

The company also tracks inventory levels across its 9 internal stores and 3 rented warehouses to ensure raw material availability without overstocking. Overall Equipment Effectiveness (OEE) is relevant given the fully automated, PLC-operated production lines, where any downtime directly impacts output. Reject and defect rates are monitored through the quality inspection process that is carried out after every material receipt and before final dispatch.

8.2 Supply Chain Drivers

Facilities: The company operates manufacturing plants in Lahore (Sundar Industrial Estate) and Multan. The production process is fully automated, running on Programmable Logic Controller (PLC) systems with no manual intervention. Machinery is sourced from world-leading German suppliers including W&H (Windmöller & Hölscher), Bobst, and Riviera all of which maintain excellent long-term relationships with Packages and provide the latest equipment.

- **Inventory:** Packages maintains 9 dedicated internal stores holding chemicals, additives, paper, aluminum foil, and other raw materials. In addition, three large rented warehouses (ranging from 70,000 to 90,000 square feet each) are used for storing finished goods two are dedicated to Unilever and one to Moland, located in Sundar (Lahore) and Multan. This arrangement ensures that key customers always have stock readily available near their own facilities.
- **Transportation:** Raw materials are imported primarily from China, South Africa, and Canada via sea freight, arriving at Karachi Port. A clearing agent handles customs and port formalities, after which goods are transported by truck to Lahore (Gujra / Sheikhpura area) and Multan. Finished products are distributed to customer factories and warehouses using a third-party road transport model.

- **Information:** All processes at Packages are system-based nothing is done manually. The procurement cycle (PR creation, PO issuance, RSQ, pre-qualification, and supplier review) runs entirely through the ERP system. Customer onboarding, order management, and supplier audits are all managed digitally, ensuring accuracy and traceability across the supply chain.
- **Sourcing:** The company operates a structured Purchase-to-Pay cycle. Production planning issues a 6-month demand forecast, which drives purchase requisitions. For international suppliers, a Letter of Credit (LC) is opened through the bank, specifying material quantities, source country, and delivery terms. For European and UK suppliers, the LC process is strictly followed. Local vendors are also used for lower-volume materials, though the company's relationship with local vendors is less formal than with its international machinery and raw material suppliers.

9. Supply Chain Distribution Modeling

9.1 Distribution Network Overview

Packages Convertor Limited follows a direct distribution model for its B2B operations (Flexible and Carton divisions). Since clients are manufacturing companies not retail consumers finished packaging is delivered directly from the Lahore and Multan plants to customer factories. There are no distributors, stockists, or retail channels involved in the B2B supply chain.

For the Consumer Products division (Rose Petal, tissue paper, toilet roll), distribution follows a B2C model where products reach end consumers through retail channels including supermarkets, utility stores, and general trade outlets.

9.2 Modes of Distribution

The primary mode of domestic distribution is road transport. Finished goods are loaded onto trucks and delivered directly to client factories or rented warehouses. For raw material import, sea freight is the main mode goods arrive at Karachi Port and are then transported by road to Lahore and Multan. Air freight is reserved for emergency or urgent import shipments only.

- **Inbound Transportation (Raw Materials):**

Raw materials including chemical wood pulp, polymer films, inks, and specialty paperboard are entirely imported. Sea freight arrives at Karachi Port, after which materials travel 1,200 km by road

d to the Lahore-Kasur manufacturing campus. This overland journey represents PCL's longest lead-time vulnerability. A 72-day inventory buffer is maintained specifically to absorb port delays, customs clearance variability, and road freight disruptions.

- **Outbound Transportation (Finished Goods to Domestic Customers):**

Finished packaging products folding cartons, flexible film rolls, and tissue bales are loaded directly from Lahore or Kasur factories onto trucks for customer delivery. For Karachi-based clients, finished goods either travel by road from Lahore (1,200 km via M-2 and M-9 motorways) or are produced directly at the Karachi plant.

- **Export Transportation:**

For international customers in the Middle East, Africa, Sri Lanka, and South Asia, sea freight via the Port of Karachi is the primary mode, using shipping containers for bulk dispatch.

- **Air Freight (Limited Use):**

Air freight is reserved exclusively for urgent, time-sensitive sample shipments or small specialty orders for multinational clients requiring packaging for new product launches on tight timelines

9.3 Warehousing Structure

The company maintains 9 internal stores within its manufacturing facilities for raw materials such as chemicals, additives, paper, and aluminum foil. Beyond these, three large rented warehouses (bear houses) provide additional storage capacity. Two of these are dedicated to Unilever's finished goods and one to Moland, all located in Sundar (Lahore) and Multan. Rent is charged on a per-square-foot basis, with the facilities ranging between 70,000 and 90,000 square feet in size.

9.4 Centralized vs. Decentralized Model

The production and dispatch operations are centralized at the Lahore plant, with secondary support from the Multan facility. This centralized model allows the company to maintain quality control, standardized processes, and unified inventory management. The rented warehouses near major client locations serve as forward stocking points, partially decentralizing the storage function to reduce last-mile delivery times for key accounts.

10. Manufacturing Process Map

The manufacturing process at Packages Convertor Limited is fully automated, operated through PLC (Programmable Logic Controller) systems with no human intervention on the production lines. The process follows a clear, sequential flow:

- **Step 1 – Raw Material Receipt & Inspection:** Imported and locally sourced raw materials arrive at the facility. Before being released to production, all incoming materials go through a quality inspection. Only materials that pass the inspection are moved into the stores; non-conforming items are quarantined and returned to suppliers.
- **Step 2 – Pre-Press & Order Preparation:** Customer artwork and specifications are processed in the pre-press department. Printing cylinders are engraved or plates are prepared according to the job requirements. Press proofs are approved by the customer before production begins.
- **Step 3 – Sheet Cutting:** Rolls of substrate material (film, paper, foil) arrive and are cut into the required sheet sizes or slit to specified widths depending on the job requirements.
- **Step 4 – Printing:** Sheets or rolls are fed into automated printing machines. The design is applied in layers using gravure or flexographic printing. The automated splicing system ensures uninterrupted production by joining new rolls to running rolls without stopping the machine.
- **Step 5 – Lamination & Folding:** Printed substrates are laminated with functional barrier layers (polyethylene, aluminum foil, etc.) to provide the required moisture, oxygen, or light protection. For carton products, the printed and laminated sheets are then folded into the final box or carton form.
- **Step 6 – Quality Inspection & Dispatch:** Finished products go through final quality checks covering print accuracy, seal strength, dimensional tolerances, and barrier properties. Approved goods are packed, labeled, and dispatched to client warehouses or factories as per the delivery schedule.

11. Generalized Supply Chain Model

The supply chain of Packages Convertor Limited spans from global raw material suppliers to end customers, and in the case of Consumer Products, all the way to the final consumer.

- **Tier 3 – Raw Material Origins:** Pulp for tissue paper is sourced from China, South Africa, and Canada. Polymer resins, polyethylene, aluminum foil, chemicals, and dyes are sourced from international suppliers, predominantly from Asia and Europe. These are commodity materials procured through long-term contracts and LC-based payment terms.
- **Tier 2 – Direct Material Suppliers:** Substrate films (BOPP, PET, PE), aluminum foil, inks, adhesives, and specialty chemicals are supplied by pre-qualified international vendors. Machinery spare parts and production equipment come from German suppliers including W&H, Bobst, and Riviera. Local vendors supply lower-volume ancillary materials.
- **Tier 1 – Packages Convertor Limited (Focal Firm):** Packages receives raw materials, converts them through printing, lamination, cutting, and folding into finished packaging products. It serves as the core value-adding entity in the supply chain transforming raw substrates into branded, functional packaging for its clients.
- **Tier 0 – Customers:** B2B customers include Unilever, Nestlé, Al-Fateh, and Jalal Sons, who use Packages' flexible and carton packaging for their consumer goods. B2C customers access Rose Petal, toilet roll, and Max Epi products through retail outlets.
- **End Consumer:** The end consumer is either the FMCG buyer purchasing a product wrapped in Packages' flexible packaging, or the household consumer buying Rose Petal tissue directly. Packages' consumer products division bypasses the manufacturing customer layer entirely, going straight to retail.

12. Pipeline Mapping

12.1 Overview

Pipeline mapping tracks the physical flow of materials and the time each stage takes, from the point raw materials are ordered to the point finished goods reach the customer. For Packages

Limited, the pipeline is dominated by long import lead times upstream, with fast and automated production in the middle and efficient dispatch at the end.

12.2 Key Stages & Lead Times

Raw Material Ordering to Shipment: Once a Purchase Requisition is raised and the Letter of Credit opened, the supplier typically takes 2–4 weeks to prepare and ship the material. Sea freight from China, Canada, or Europe adds another 3–6 weeks depending on origin.

- **Port Clearance & Inland Transport:** Goods arrive at Karachi Port, where the clearing agent handles documentation and customs. Port clearance takes approximately 7–14 days, after which trucks transport the material to Lahore or Multan (1–2 days road transit).
- **Raw Material Storage:** Materials are held in the company's 9 internal stores. Depending on the procurement cycle, raw material safety stock covers 30–45 days of production requirements to buffer against import variability.
- **Production (Cutting, Printing, Lamination, Folding):** The automated production process is fast. A typical job moves through cutting, printing, lamination, and folding in 3–7 working days, depending on complexity and order size.
- **Quality Inspection & Packing:** Final inspection and packing take 1 day for standard jobs. After clearance, finished goods are transferred to the dispatch area or directly to the rented warehouses dedicated to key clients.
- **Delivery to Customer:** Road transport to customer factories in Lahore, Karachi, or Multan takes 1–3 days. For Unilever and Nestlé, deliveries go directly into their dedicated rented warehouse spaces managed by Packages.

12.3 Pipeline Insights

The total pipeline time from placing a raw material order to delivering the finished product ranges from 55 to 90 days for imported materials. When raw materials are already in stock, the entire production-to-delivery cycle shrinks to approximately 5–10 days. This makes inventory management the most critical lever for reducing lead time and ensuring order fulfillment. The dedicated warehouses for Unilever and Moland are a practical solution to this challenge, pre-positioning stock close to the customer to decouple production lead time from customer delivery expectations.

13. Recommendations

13.1 Reduce Dependence on Imported Raw Materials

The most significant vulnerability in Packages' supply chain is its heavy reliance on imported raw materials from China, South Africa, Canada, and Europe. Long sea freight lead times (3–6 weeks) and LC processing add 50–70 days to the procurement cycle. The company should invest in developing domestic alternatives for key substrates either through backward integration or by partnering with local film and foil manufacturers to reduce import dependency, lower foreign exchange exposure, and compress procurement lead times.

13.2 Strengthen Local Vendor Development

As acknowledged during our visit, the company's relationship with local vendors is not as strong as with international ones. Local vendors receive lower business volumes and less strategic attention. Given the cost advantages and shorter lead times of local sourcing, Packages should formalize a local vendor development program providing technical support, conducting capacity assessments, and gradually increasing business volumes with qualified local suppliers.

13.3 Expand Collaborative Planning with Key Customers

Currently, production planning is largely driven by firm orders. Implementing Collaborative Planning, Forecasting and Replenishment (CPFR) with major accounts like Unilever and Nestlé would allow Packages to align its production schedule with customer demand forecasts earlier, reducing last-minute rush orders, improving machine utilization, and lowering the cost of holding large safety stocks.

13.4 Improve Sustainability Practices in the Local Supply Base

The company has a dedicated sustainability team that audits suppliers on child labor, forced labor, emissions, water discharge, and financial stability. However, this appears to be applied more rigorously to international suppliers than to local vendors. Extending the same sustainability audit framework to all domestic vendors would improve supply chain integrity, meet global customer ESG requirements, and reduce reputational risk.

13.5 Invest in Preventive Maintenance & Spare Parts Management

With a fully automated, PLC-operated production environment and machinery sourced from premium German manufacturers (W&H, Bobst, Riviera), any unplanned machine breakdown creates significant production disruption. A structured preventive maintenance program and a well-managed critical spare parts inventory particularly for imported components with long lead times would reduce downtime risk and protect delivery commitments to clients.

13.6 Formalize Continuous Improvement Framework

The company has identified several continuous improvement goals including an error-free supply chain, time-bound operations, better customer relationships, and improved batch performance. These aspirations should be formalized into a structured continuous improvement program (such as Lean or Six Sigma) with defined KPIs, review cycles, and ownership. As noted during the interview, continuous improvement is a cyclical process structuring it formally will ensure progress is measurable and sustained.
